FEET

This survey was made with a K & E transit, No. 129403, with horizontal limb 6.2 inches diameter, having two double opposite verniers, and full vertical circle 5 inches in diameter, having one double vernier; the verniers read to one minute of arc; the eye piece is equipped with a colored glass for making direct observations on the sun. The instrument was in good condition at the time of the survey and all adjustments were in good order.

All azimuths in this record were determined by the method of deflection angles referred to the meridian established by direct observation on the sun November 2, 1963, at Corner No. 1 of U. S. Marble Mill Site #3, latitude 33°50'30" N., longitude 113°27'25" W., turning from a reference point in a N. W. direction clockwise to the sun in the S.E. direction.

True bearing of reference point N. 22° - 36' W.

The lines were measured with a Lufkin steel tape 300 ft. in length, graduated every foot, with the first and last foot graduated to hundredths of a foot. The tape was compared with a standard and found correct. All lines of this survey were run by direct methods.

The magnetic declination observed at each corner of the survey gave a uniform value of $15^{\circ}30^{\circ}$ E.
